

M8C-PRO and M8HC-PRO INSTRUCTIONS - English

Make sure you have the right surge protector to protect your electronic equipment. Panamax makes protectors for almost every type of electronic equipment. Surge protectors that may look identical from the outside can be very different on the inside. It is very important to use the surge protector designed for your application.

Phone Jacks

Telco and LAN Connector RJ-45
(M8C-PRO and M8HC-PRO)

Includes Phone Cable (4 ft.)
and Cat 5 Cable (4 ft.)
(M8C-PRO and M8HC-PRO)

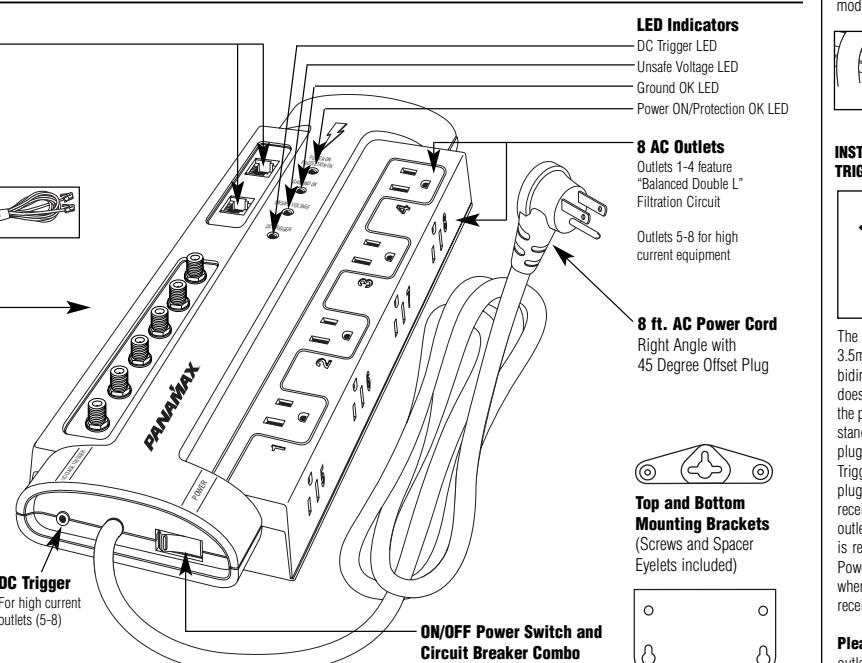

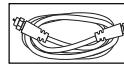

Coax Connectors

(M8C-PRO and M8HC-PRO)

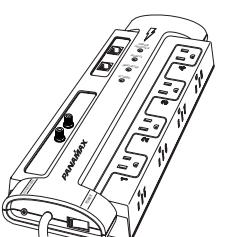

M8C-PRO
One CATV
Connector

M8HC-PRO
One CATV
and
Two Satellite
Connectors

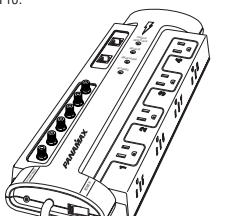

RG-6 Coax Cables
(M8C-PRO, One Cable
and M8HC-PRO, Two Cables)

M8C-PRO – Provides AC power (surge, under-voltage and over-voltage) protection, coaxial (CATV, off-air antenna or cable modem) protection and telephone line protection for electronic devices. In addition, it features a 12VDC input trigger and two banks (4 AC outlets each) of noise filtration circuitry. One, a capacitive filter circuit, is for high-current draw components like powered subwoofers or amplifiers. The other is a balanced double L filter for A/V source equipment or display devices.

M8HC-PRO – Adds dual LNB Satellite TV protection to the capabilities of the M8C-Pro.

These units have 8 AC outlets controlled by the combination power switch/circuit breaker. The 4 high-current outlets may also be controlled by a 12VDC signal from another component. These models feature Panamax's patented SurgeGate-EX™ circuitry for over and under voltage protection. This circuitry continuously monitors the power and protects against damage caused by brownouts (under-voltages) and sustained over-voltages. It automatically disconnects the power to your connected equipment when either of these conditions are detected, then re-connects it when the power returns to a safe level.

These models have 4 diagnostic LEDs for maximum safety. They are designated as follows:

- POWER ON, PROTECTION OK** – (green) normally ON; indicates that the surge protector is functioning properly and that all connected equipment is protected.
- GROUND OK** – (green) normally ON; indicates that the wall outlet is properly wired and grounded.

3. UNSAFE VOLTAGE – (red) normally OFF, flashes when lit, indicates that incoming voltages are unsafe and the surge protector has disconnected the power to your connected equipment.

- 4. DC Trigger** – (green) ON/OFF status depends upon whether or not a 12VDC signal is being received from another component.
- ON** = DC voltage signal is being received and high-current outlets are **ON**;
- OFF** = No signal from source component and power to high-current outlets is **OFF**.

The M8-Pro family has been designed with flexibility and expansion in mind. All of these models will accept add-on signal-line protection modules in the event that your installation has more signal-lines than can be protected with one of the above units. More information is available on our website (www.panamax.com) or from our Customer Support Department (800-472-5555; 7:30AM – 4:30PM PST).

If you have any questions about which protector is best for your application, please check our website (www.panamax.com) or contact Panamax Customer Support.

PROPERLY CONNECTING YOU SURGE PROTECTOR

To completely protect your equipment from surges, every wire leading into or out of the equipment you want to protect must be connected to the appropriate Panamax surge protector. Damaging lightning and power surges can enter your system through any AC power or signal-line (phone line, grounding wires, coax cables, modem cables, LAN cables, etc.) connected to your electronic equipment.

NOTE to TV ANTENNA, SATELLITE DISH and CATV INSTALLERS: Articles 810.21 and 820.40 of the NEC provide specific guidelines for proper grounding, and in particular, specify that the cable ground shall be connected to the grounding system of the building, as close to the point of cable entry as practical.

INSTALLATION (AC Power):

- Turn **OFF** the power to all equipment that will be plugged into the unit.

- Make sure that the **ON/OFF** switch is in the **OFF** position (see figure). Plug the unit into the wall outlet and then turn it **ON**.

- Verify that the green "Ground OK" LED is lit, indicating that the wall outlet is properly wired and grounded.

- Plug the equipment to be protected into the Panamax unit and one at a time, turn each piece of connected equipment ON and check for correct operation.

- Audio/Video equipment like receivers, DVD players, TVs, etc. should be plugged into the outlets numbered **1-4**. This bank of outlets provides power from a "Balanced Double L" filtration circuit so that EM/RFI noise is prevented from reaching your source/display equipment.

Do not use 2-blade adapters or any other "power strips" with this product. Use only Panamax extension cords if a longer cord is required.

NOTE to TV ANTENNA, SATELLITE DISH and CATV INSTALLERS:

Articles 810.21 and 820.40 of the NEC provide specific guidelines for proper grounding, and in particular, specify that the cable ground shall be connected to the grounding system of the building, as close to the point of cable entry as practical.

3. Plug a telephone or LAN line into the **EQUIP** jack and then plug the other end into the equipment to be protected.

- Turn **ON** the protector and the connected equipment. Verify that each piece of connected equipment is receiving power and signal.

- Turn **OFF** the unit and all connected equipment before connecting any signal-lines or installing any add-on signal-line modules.

INSTALLATION & OPERATION OF DC TRIGGER (optional):

The DC Trigger input uses a standard 3.5mm (1/8") mono jack. The circuitry is bidirectional regarding signal polarity so it doesn't matter whether the center-pin of the plug is positive or negative. Connect a standard 2-wire cable with a 3.5mm mini-plug from your source component's DC Trigger output (or appropriate AC Adapter plugged into a switched outlet on your receiver) to this jack. The 4 high-current outlets turn **ON** when a DC voltage signal is received from your source component. Power to these 4 outlets is turned **OFF** when a DC voltage signal is not being received.

Please note: Power to the high-current outlets will be controlled by the combination power switch/circuit breaker if nothing is plugged into the DC Trigger jack.

INSTALLATION (Telephone or LAN Lines):

IMPORTANT: Note the position of the **LINE** and **EQUIP** jacks on the Panamax unit. **LINE** is for the line connection that comes from the wall or floor jack. **EQUIP** is for the line connection to your connected equipment. The protection circuit will only function if connected properly. Reversed connections will pass the signal to the connected equipment but will also prevent the protection circuitry from working and will invalidate the Panamax Connected Equipment Protection Policy.

- Place a spacer eyelet on one of the #6 pan-head screws with the flared end of the eyelet toward the wall. Drive the screw into the wall (use the included drywall anchors for hollow walls) at the marked location, leaving the eyelet exposed.
- Position the key-hole on the unit's top mounting bracket over the eyelet/screw and slide the unit down to lock the screw-head into the bracket.
- Mark the location for the two lower mounting screws (in the narrow portion of the key-holes) and drive the screws into the wall using the other 2 spacer eyelets like in step #3. The included drywall anchors should be used for mounting on hollow walls.

- Make sure the Panamax protector and all connected equipment is turned **OFF**.

- Connect the coaxial cable from the CATV system, antenna or Satellite dish to the appropriate **LINE** connector on the Panamax protector.

- Connect a coaxial cable from the **EQUIP** jack on the protector to appropriate input jack on your TV, VCR, Satellite receiver or cable modem.

- Repeat steps 2 & 3 for all additional coaxial lines.

ADDING SIGNAL-LINE MODULES (Optional):

Some connected equipment may have more signal-lines than can be protected by the base unit alone. Panamax offers a line of add-on signal-line modules (sold separately) for these situations. Each module includes installation instructions and a

INSTALLATION (Coaxial Lines):

IMPORTANT: Note the position of the **LINE** and **EQUIP** jacks on the Panamax unit. **LINE** is for the line connection that comes from the wall or floor jack. **EQUIP** is for the line connection to your connected equipment.

Panamax offers two types of coaxial line protection:

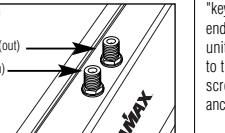

- Satellite TV
- Cable TV (CATV), Off-air antenna or Cable modem

Each one is optimized for the specific application and **can not** be used with the other. Detailed information may be found on the Panamax website (www.panamax.com).

NOTE: The CATV/Off-Air Antenna protection circuit in these models is bi-directional and has been designed to work with cable TV systems that send pay-per-view ordering information to the cable company over the coaxial line.

The **M8C-PRO** provides protection for one CATV, off-air antenna or cable modem line. It is **not** compatible with Satellite TV. When used with diplexers, this protection circuit must be placed between the diplexer and the TV or VCR; it will **not** protect the diplexer.

Please note: Power to the high-current outlets will be controlled by the combination power switch/circuit breaker if nothing is plugged into the DC Trigger jack.

WALL MOUNTING (optional):

The small triangular bracket with one "key-hole" is for the top end of the unit. This bracket mounts directly to the back of the unit with the #8-32 x 5/16" machine screws, then to the wall with one of the #6-20 x 3/4" pan-head screws and spacer eyelets (drywall anchors optional).

The large rectangular bracket with two "key-holes" is for the bottom, line-cord end of the unit. It mounts directly to the unit with the thread-forming screws, then to the wall with the other two #6 pan-head screws and spacer eyelets (drywall anchors optional).

Mounting procedure:

- Mount both brackets to the unit with the appropriate screws.

- Determine the mounting location on the wall and mark the position for the top mounting screw.

There is no audio or video for my TV, stereo or VCR.

Check the coaxial connections, making sure they are correctly and securely installed.

Bypass the coaxial connectors. If your picture returns, the protector is damaged. Contact Panamax (website or Customer Support Department) for replacement.

If you still have no picture, a problem with your cable provider's signal may exist.

My fax machine, modem or telephone has AC power but still does not work.

Check to see if your connected equipment is receiving a dial tone.

If not, bypass the surge protector's phone jacks to see if the protector is damaged.

If your dial tone returns, the protector is damaged. Contact Panamax (website or Customer Support Department) for replacement.

If you still have no dial tone, a problem with the phone company's lines may exist.

The Panamax circuit breaker disconnects AC power from the connected equipment.

You have exceeded the ampere rating for your surge protector. As a temporary fix, disconnect one or more pieces of equipment. Ask your Panamax dealer about additional Panamax protectors that may be required.

CONNECTING YOUR SURGE PROTECTOR

Some connected equipment may have more signal-lines than can be protected by the base unit alone. Panamax offers a line of add-on signal-line modules (sold separately) for these situations. Each module includes installation instructions and a

WALL MOUNTING (optional):

The small triangular bracket with one "key-hole" is for the top end of the unit. This bracket mounts directly to the back of the unit with the #8-32 x 5/16" machine screws, then to the wall with one of the #6-20 x 3/4" pan-head screws and spacer eyelets (drywall anchors optional).

small rectangular bracket with a grounding interface. This bracket replaces the small triangular wall-mount bracket that comes with the AC base unit and is needed only when add-on modules are being installed. More information may be obtained on the Panamax website or by calling our Customer Support Department.

TROUBLESHOOTING

If you are having problems with your surge protector, read this section.

The "Power On/Protection OK" LED is not lit, there is no AC power to my equipment, or my equipment does not turn on.

- Make sure that the protector is plugged into a working AC outlet.

- Check all AC power connections.

- Make sure that the protector and connected equipment are turned on.

- If using the DC Trigger input, verify that the source equipment is providing the proper DC voltage signal.

- Verify that the "Unsafe Voltage" LED is not lit. If it is on, the incoming line voltage is either too high or too low and has been disconnected from your connected equipment.

- Check to see if the circuit breaker on the surge protector (combination power switch/circuit breaker) needs to be reset (press "ON" to reset).

- If you still have no power, the protector may be damaged. Contact Panamax (website or Customer Support Department) for replacement.

POWER ON, PROTECTION OK

1. Power On, Protection OK – (green) normally ON; indicates that the protector is functioning correctly and that your equipment is protected.

2. Ground OK (tierra OK) – (green) normally ON; indicates that the ground connection is correct and that the equipment is properly grounded.

3. Unsafe Voltage (voltaje peligroso) – (red) normally OFF; indicates that the incoming line voltage is either too high or too low and has been disconnected from your connected equipment.

4. DC Trigger (disparador de corriente continuo) – (green) the status ON/OFF depends on whether or not a 12VDC signal is present.

ON = The signal of voltage of current continuous (DC) is being received and the enclaves of high current are ON;

OFF = No signal of voltage of current continuous (DC) is being received and the enclaves of high current are OFF.

It is common that a building is not correctly connected to ground. To protect your equipment, the products of Panamax should be inserted directly into a ground connection to the building. Additionally, the ground connection should be made correctly and securely. It is recommended that Panamax products be inserted into a ground connection to the building. Additionally, the ground connection should be made correctly and securely. It is recommended that Panamax products be inserted into a ground connection to the building.

5. My fax machine, modem or telephone has AC power but still does not work.

Check to see if your connected equipment is receiving a dial tone.

If not, bypass the surge protector's phone jacks to see if the protector is damaged.

If your dial tone returns, the protector is damaged. Contact Panamax (website or Customer Support Department) for replacement.

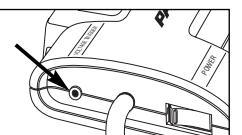

If you still have no dial

M8C-PRO and M8HC-PRO INSTRUCTIONS - Español, (continued)

5. Apague la unidad y todo el equipo conectado antes de conectar cualquier línea de señal o instalando módulos adicionales de línea de señal.

Instalación y operación del disparo de corriente continua (DC) (opcional):

La entrada del disparo de corriente continua (DC) usa un enchufe estándar de 3.5mm (1/8"). El circuito es bidireccional en lo que respecta a la polaridad de señal, de esta forma no importa si la patilla central del enchufe es positivo o negativo. Conecte un cable de 2-alambres con un mini-enchufe de 3.5mm de la salida de su disparo de corriente continua (DC) (o adaptador de CA enchufado a un tomacorriente en su receptor) de su componente fuente a este enchufe. Los 4 tomacorrientes de alta corriente se encienden cuando la señal de voltaje de corriente continua (DC) es recibida de su componente fuente. Cuando no recibe la corriente continua (DC) los 4 tomacorrientes se apagan.

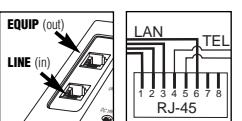

Favor de notar: La electricidad a los tomacorrientes de alta corriente serán controlados por el circuito/commutador combinado si no hay nada enchufado en el enchufe de disparo de corriente continua (DC).

Instalación (Teléfono o líneas de red de área local (LAN):

IMPORTANTE: Note la posición de los enchufes LINE y EQUIP en la unidad Panamax. LINE es para la conexión de línea que viene del enchufe en la pared o el piso. EQUIP es la conexión de línea para su equipo conectado. El circuito de protección sólo funcionará si esté correctamente conectado. Conecciones en reversa pasan la señal al equipo conectado pero también no permitirá que el circuito funcione y esto hará que la Garantía de Protección de Equipo Conectado de Panamax sea inválida.

Los dos modelos Pro (M8C-Pro & M8HC-Pro) proveen protección para teléfono y red de área local en un juego de enchufes RJ-45 (que es RJ-11 compatible). El circuito de teléfono usa patillas 4 y 5 mientras el circuito de red de área local usa las patillas 1, 2, 3 y 6. Adaptadores o cables hechos de encargo (no incluidos) deben ser usados cuando se utilizan los dos circuitos de protección al mismo tiempo.

M8C-PRO and M8HC-PRO

1. Asegúrese que el protector Panamax y todo el equipo conectado esté apagado.

2. Tome el cable de teléfono o red de área local (LAN) y enchúfelo al enchufe correcto (LINE) en el protector. El cable debe estar conectado entre la pared y la unidad Panamax.

3. Enchufe el cable de teléfono o red de área local (LAN) al enchufe EQUIP y entonces enchufe la otra punta al equipo que va ser protegido.

4. Encienda el protector y el equipo conectado. Verifique que cada pieza del equipo conectado esté recibiendo electricidad y señal.

Instalación (Líneas Coaxiales):

IMPORTANTE: Note la posición de los enchufes LINE y EQUIP en la unidad Panamax. LINE es para la conexión de línea que viene del enchufe en la pared o el piso. EQUIP es la conexión de línea para su equipo conectado.

Panamax ofrece dos tipos de protección para líneas coaxiales:

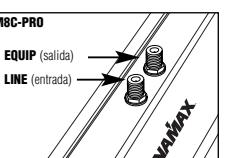

1) Televisión por Satélite \

2) Televisión por cable, antena fuera de aire o modem por cable.

Cada uno está optimizado para una aplicación específica y no puede ser usado con el otro. Puede encontrar información más detallada en el sitio web de Panamax (www.panamax.com)

NOTA: El circuito de protección de CATV/Antena fuera de aire en estos modelos es bi-direccional y ha sido diseñado para funcionar con sistemas de cable TV que envían información para ordenar programación de pago y ver a la compañía de cable por medio de la línea coaxial.

El MBC-Pro provee protección para un cable CATV, antena, o modem por cable. No es compatible con televisión de satélite. Cuando diplexores son usados, este circuito de protección debe ser puesto entre el diplexor y el televisor o videograbadora; el diplexor no será protegido.

Los dos modelos Pro (M8C-Pro & M8HC-Pro) proveen protección para teléfono y red de área local en un juego de enchufes RJ-45 (que es RJ-11 compatible). El circuito de teléfono usa patillas 4 y 5 mientras el circuito de red de área local usa las patillas 1, 2, 3 y 6. Adaptadores o cables hechos de encargo (no incluidos) deben ser usados cuando se utilizan los dos circuitos de protección al mismo tiempo.

Procedimiento para montaje:

No hay audio o video de mi televisor, stereo o grabadora de video

1. Monte los soportes a la unidad con los tornillos correctos.

2. Determine a donde va a montar la unidad en la pared y marque la posición para el tornillo superior.

3. Ponga un ojete separador, con la parte acampanada hacia la pared, uno de los tornillos #6. Atornille la unidad a la pared (usando los sujetadores de mampostería para paredes huecas) dando marco, dejando el ojete expuesto.

Mi fax, modem, o teléfono están conectados al protector pero no funcionan:

• Revise las conexiones coaxiales, asegúrandonos de que estén instaladas correctamente y bien sujetadas.

• Derive los conectores coaxiales. Si la imagen regresa, el protector está dañado.

• Póngase en contacto con Panamax (ya sea por el sitio web o el departamento de atención al cliente) para un reemplazo.

• Si todavía no tiene una imagen, es posible que exista un problema con la señal de su proveedor de cable.

Mi fax, modem, o teléfono están conectados al protector pero no funcionan:

• Si no, derive el enchufe de teléfono del protector para ver si el protector está dañado.

• Si el tono de marcar regresa, el protector está dañado. Póngase en contacto con Panamax (ya sea por el sitio web o el departamento de atención al cliente) para un reemplazo.

• Si todavía no tiene tono de marcar, es posible que exista un problema con la línea de teléfono.

1. Asegúrese que el protector Panamax y todo el equipo conectado esté apagado.

2. Conecte el cable coaxial del sistema CATV, antena fuera de aire o satélite al conector LINE en el protector Panamax.

3. Conecte un cable coaxial del conector EQUIP en el protector al enchufe en su TV, VCR, receptor de satélite, o modem de cable.

4. Coloque el protector sobre los 3 ojetes/tornillos y deslízale la unidad hasta que quede sujetó en lugar.

5. Usando este procedimiento permite que la unidad pueda ser quitado fácilmente deslizándolo hacia arriba para soltar los soportes de los ojetes/tornillos.

Añadiendo módulos de línea de señal (opcional):

Es posible que haya equipo conectado que tenga mas líneas de señal que la unidad base pueda proteger. Panamax ofrece una línea accesorios de módulos de línea de señal (que se compran separadamente) para este tipo de situación. Cada módulo incluye instrucciones de instalación y un soporte pequeño rectangular con un interfaz de tierra. Este soporte reemplaza el soporte triangular pequeño que viene con

Montaje en la pared (opcional):

El soporte pequeño triangular con un "hoyo de llave" es para la parte superior de la unidad. Este soporte se monta directamente a la parte trasera de la unidad con los tornillos #8-32 x 5/16", y entonces a la pared con uno de los tornillos #6-20 x 1/4" y ojete separador (sujetadores de mampostería es opcional).

Panamax ofrece dos tipos de protección para líneas coaxiales:

1) Televisión por Satélite \

2) Televisión por cable, antena fuera de aire o modem por cable.

Cada uno está optimizado para una aplicación específica y no puede ser usado con el otro. Puede encontrar información más detallada en el sitio web de Panamax (www.panamax.com)

Resolviendo problemas – Si usted está teniendo problemas con su protector contra sobrecargas de tensión, lea esta sección

El diodo emisor de luz (LED) "POWER, PROTECTION OK" no está prendido, no hay corriente alterna (CA) a mi equipo, o mi equipo no enciende.

• Asegúrese que el protector esté funcionando a un tomacorriente que esté funcionando.

• Revise todas las conexiones AC.

• Asegúrese que el protector y el equipo estén encendidos.

• Si está usando el disparador de corriente continua (DC Trigger), verifique que el equipo que es la fuente esté preveyendo una señal correcta de voltaje de corriente continua (DC).

• Verifique que el diodo emisor de luz (LED) "Unsafe Voltage" no esté prendido. Si está prendido, el voltaje que está entrando es demasiado alto o bajo y ha sido desconectado de su equipo conectado.

• Revise el corta circuito en el protector (el cortacircuitos/comutador combinado) para ver si necesita ser reconfigurado (presione "ON" para reconectar).

• Si todavía no enciende, el protector puede estar dañado. Póngase en contacto con Panamax (ya sea por el sitio web o el departamento de atención al cliente) para reemplazar el protector.
